At the Infra-Floor® Series the generation of a very effective but inaudible resonance of the floor tiles was achieved by the involvement of electrophysical fundamentals. The Amplitude of the Infrasonic-Signal counts up to 5mm!

The Sound-Floor® Series can carry forward a sonic signal, invisibly due to the floor tiles. High class transducers are responsible for a crystal clear and audible sound. All Systems can be covered with all kinds of flexible floor cloths. By the means of a ingenious locking system easy combination of single modules.
